

Putting all the code together.

June 9, 2015

(1)

from program1.py to program4.py
in
astrometric Catalogue.py

Issues

In the flowchart → use median RA & dec values to find all objects within ~~the~~ search radius.

(1)

↓
BUT we discussed we need to find using all the values of RA/dec since

even if one value lies inside
we have to take it

→ but the median here might not lie inside!

robust

(2) What abt rms.?

(3) Which library contains match()? (I copied all for now!)
